Recruiters know that over 70% of the best candidates aren't looking. They spend hundreds of hours researching candidates, and most don't respond to emails or InMails. Resume filters are inaccurate and manual filtering, prioritizing, and writing is difficult and time consuming.

Millions of LinkedIn profiles are fakes. Phishers lure recruiters and then send resume with malware that can cost firms millions in ransomware and lawsuits. How can you prevent this *and* leverage the latest advancements in ChatGPT, AI, and behavioral science, as well as Occupational Network (O*NET) data, to pre-assess for the right experience and soft skills? Also, personalize phone scripts, email, and LinkedIn messages to drive higher response rates and job interest?

"This groundbreaking app with automated ChatGPT personalized prompts can save hundreds of hours analyzing contacts and personalizing messages."
–VP Talent Acquisition, Talend/Qlik

With the **RemotelyMe PDQAPP**, simply find a contact on LinkedIn and click once. The contact's data is extracted and analyzed with AI and neuroscience. Experience, skills, interests, and more are combined with ChatGPT, AI, O*NET, and neuroscience data and matched against your job requirements to determine scores. Also, profiles are flagged for suspicious content from phishers or dishonest candidates.

Automated ChatGPT prompts create personalized emails, LinkedIn messages, and phone scripts written in the contact's native language. Also, trust-building playbooks that can save you hundreds of hours while dramatically increasing resonance, response, and hiring rates. Even better, you can invite candidates to our exclusive LinkedIn Leaders Forum group to entice them to respond.
